

AMENDMENTS TO THE CLAIMS

1. (Original) A method of processing commands comprising
receiving and storing in a memory a first command line interface, the first
command line interface processing commands addressed to boards of a first board type;
receiving and storing in memory a second command line interface, the second
command line interface processing commands addressed to boards of the first board type;
and
processing a first command using the first command line interface and a second
command using the second command line interface, the first command and the second
commands addressed to boards having the first board type.
2. (Original) The method of claim 1 further comprising routing a single
command to multiple boards using the first command line interface.
3. (Original) The method of claim 1 wherein the first and second
commands are CLI commands.
4. (Original) The method of claim 1 further comprising converting the
first and second commands from a first protocol to a second protocol.

5. (Original) The method of claim 4 wherein the first protocol is CLI and the second protocol is SNMP.

6. (Original) A system for downloading a software image, the system comprising:

a plurality of boards, each of the boards having a slot number and a chassis number;

a network management station having an interface, the interface allowing an operator to enter a command, the command having a destination slot number and destination chassis number;

a system manager coupled to the network management station and to the plurality of boards, the system manager storing a plurality of command line interfaces, each of the command line interfaces processing commands addressed to boards having a board type and a version number;

wherein the system manager determines the destination slot number and chassis number of the command, and wherein the command line interface associated with the slot number and the chassis number processes the command;

wherein one of the plurality of boards is updated with a new image and a new command line interface, and wherein, thereafter, a command having a destination of the slot number and chassis number of the board is routed to the new command line interface, and

wherein commands addressed to others of the plurality of boards of the same board type as the one of the plurality of boards are routed to other of the command line interfaces.

7. (Original) A method for downloading a software image, the method comprising:

receiving a software image, the software image including a first command line interface, the command line interface for processing commands addressed to at least one board, the at least one board having a first board type and a first version number;

storing the first command line interface in memory; and

receiving a command at the first command line interface, the command addressed to the at least one board, processing the command at the first command line interface, and forwarding the command to the at least one board.

8. (Original) The method of claim 7 further comprising:

receiving a second image having a second command line interface and storing the second command line interface in the memory, the second command line interface for processing commands addressed to boards of the first board type and a second version number; and

thereafter, processing some commands using the first command interface and other commands using the second command interface.

9. (Original) A system manager, the system manager comprising:
a memory, the memory for storing a first command line interface, the first command line interface processing commands addressed to boards of a first board type, the memory also receiving and storing a second command line interface, the second command line interface processing commands addressed to boards of the first board type; and

a processor coupled to the memory, the processor for processing a first command using the first command line interface and a second command using the second command line interface, the first command and the second commands addressed to boards having the first board type.

10. (Currently Amended) The system manager of claim 9 wherein the processor receives commands addressed to multiple boards and routes the commands ~~boards~~ to the multiple destinations.

11. (Original) The system manager of claim 9 wherein the commands are CLI commands.

12. (Original) The system manager of claim 9 wherein the commands are converted from a first format to a second format.

13. (Original) The system manager of claim 12 wherein the second format is SNMP.

14. (Original) A system for processing commands comprising:

means for receiving and storing in a memory a first command line interface, the first command line interface processing commands addressed to boards of a first board type;

means for receiving and storing in memory a second command line interface, the second command line interface processing commands addressed to boards of the first board type; and

means for processing a first command using the first command line interface and a second command using the second command line interface, the first command and the second commands addressed to boards having the first board type.

15. (Original) The system of claim 14 further comprising means for routing a single command to multiple boards using the first command line interface.

16 (Original) A computer program for processing commands comprising first code for receiving and storing in a memory a first command line interface, the first command line interface processing commands addressed to boards of a first board type;

second code for receiving and storing in memory a second command line interface, the second command line interface processing commands addressed to boards of the first board type; and

third code for processing a first command using the first command line interface and a second command using the second command line interface, the first command and the second commands addressed to boards having the first board type.

17. (Original) A computer readable medium having stored therein instructions for causing a processing unit to execute the following method:

processing commands comprising;

receiving and storing in a memory a first command line interface, the first command line interface processing commands addressed to boards of a first board type; receiving and storing in memory a second command line interface, the second command line interface processing commands addressed to boards of the first board type; and

processing a first command using the first command line interface and a second command using the second command line interface, the first command and the second commands addressed to boards having the first board type.
